How EcoPreserve's Competitors Are Using AI

Competitor research | October 17, 2026

1. Arcadis: AI for reviewing project documents

Link: https://www.arcadis.com/en/news/global/2026/2027-2029-strategy-arcadis-reset-focused-growth-sustainable-value/

Why I picked this source: I picked this source because Arcadis works in sustainability, engineering, and the built environment, and its use of AI is very close to EcoPreserve's document organization problem.

What the competitor is doing with AI: Arcadis says more than 400 engineers in 17 countries use over 700 employee-built AI workflows. These workflows help analyze drawings, review specifications, and process complicated project information. Arcadis says this is helping improve productivity, quality, and client outcomes.

What EcoPreserve could learn: EcoPreserve could start with a small version of this idea: AI checks file names, sorts documents for one certification requirement, and creates an easy-to-read document index for the project manager.

2. ERM: AI agents for sustainability research

Link: https://www.erm.com/unindexed/home/about/news/erm-and-auquan-bring-agentic-ai-to-sustainability-advisory/

Why I picked this source: I chose ERM because it is a major sustainability consulting firm. This example shows how AI can handle research-heavy tasks so consultants can spend more time using their expertise.

What the competitor is doing with AI: ERM is working with Auquan to use AI agents in sustainability related due diligence. The tools search news, regulatory disclosures, and other reports to flag possible risks involving companies. The goal is to help clients receive faster, more detailed information when making investment decisions.

What EcoPreserve could learn: EcoPreserve could use a similar research-assistant approach to flag missing project records or quickly bring together relevant information, while allowing the consultant to verify every result.

3. ERM: AI for supply-chain emissions

Link: https://www.erm.com/unindexed/home/about/news/erm-and-carbmee-bring-ai-to-scope-3-turning-data-into-decarbonization-action/

Why I picked this source: I picked this second ERM source because it connects AI directly to carbon reduction work, another type of service that EcoPreserve provides.
What the competitor is doing with AI: ERM partnered with Carbmee to help manufacturing clients understand emissions connected to suppliers and products. Carbmee's AI-powered platform gathers detailed emissions data and helps identify where the biggest carbon impacts are. Clients can use the information to compare choices and plan reductions.
What EcoPreserve could learn: EcoPreserve could eventually use structured AI-assisted data checks for building emissions or electrification projects, but only if input data and calculations are verified by staff.

4. AECOM: AI for environmental risk assessments

Link: https://aecom.com/press-releases/aecom-and-the-sustainable-markets-initiative-debut-ai-powered-nature-risk-tool-at-nyc-climate-week-2024/

Why I picked this source: I selected AECOM because it is a large infrastructure and environmental consulting company. Its tool is a clear example of AI making complex environmental research easier for clients to understand.
What the competitor is doing with AI: AECOM developed an AI-powered Nature Risk Tool that brings together environmental research and location data. It helps clients see possible risks to wildlife, biodiversity, and nature before choosing a site or planning a project. AECOM says the tool can shorten certain early risk assessments from weeks to hours.
What EcoPreserve could learn: EcoPreserve could apply the same idea on a smaller scale: combine information from many files into one clear report that makes review easier for project managers and clients.

5. WSP: AI-enabled environmental intelligence

Link: https://www.wsp.com/en-us/hubs/environmental-intelligence

Why I picked this source: I chose WSP because it offers environmental and sustainability services. Its work shows how AI can turn large amounts of complicated environmental data into useful client information.

What the competitor is doing with AI: WSP describes Nature Vista, an AI-enabled platform that combines information about natural environments and physical assets. It uses AI and data analysis to help clients spot environmental risks and make decisions throughout a project.

What EcoPreserve could learn: EcoPreserve could aim for the same clear-output approach by giving project managers a simple summary of inconsistent file names, missing items, and documents that need a human review.

6. Jacobs: AI to predict flooding and support clients

Link: https://www.jacobs.com/newsroom/press-release/jacobs-introduces-flood-iq-help-utilities-and-cities-anticipate-and-manage

Why I picked this source: I picked Jacobs because it serves governments and infrastructure clients, like some of EcoPreserve's clients. This is a concrete example of AI improving a service rather than simply cutting office work.

What the competitor is doing with AI: Jacobs introduced Flood IQ, which uses AI, sensors, and water-system information to help cities and utilities predict floods and respond sooner. Jacobs also describes a machine-learning application on a UK sewer network that it says reduced sewer flooding and pollution events by about 20%.

What EcoPreserve could learn: EcoPreserve could learn from Jacobs' focus on making information useful at the right moment. For example, AI could alert a project manager about a missing required file before a certification package is submitted.

7. Stantec: AI and flood preparedness

Link: https://www.stantec.com/en/projects/united-states-projects/t/tennessee-flood-predictor-integration

Why I picked this source: I chose Stantec because it combines environmental consulting, climate services, and digital solutions. Its work is relevant to how AI can support public-sector projects.

What the competitor is doing with AI: Stantec describes work to improve flood prediction and resilience in Tennessee. On its project page, it highlights combining engineering knowledge with AI to improve preparation for and response to major weather events. The public project description does not provide a clear numerical AI-only performance result.

What EcoPreserve could learn: EcoPreserve could use the same general idea of combining technology with expert review. AI can prepare the information, but the consultant should make the final technical decision.

---

1. Arup

Arup is a global consulting company that works in engineering, design, buildings, infrastructure, cities, and sustainability. It helps organizations plan and improve complicated projects such as buildings, energy systems, transportation, and city development.

Arup is a broad competitor because some of its services overlap with EcoPreserve. Both companies help clients make buildings and operations more sustainable, improve performance, reduce environmental impact, and make better long-term decisions. Arup is much larger, but that makes it useful for seeing where the consulting industry may be heading.

Arup applies AI and machine learning to analyze building and infrastructure performance and support the design of low-carbon energy systems. These tools can process large volumes of operational and design data, identify recurring patterns, and highlight potential improvements that might be difficult to spot through manual review alone. For clients, this can mean more informed comparisons between design options and a clearer understanding of where energy or operational improvements may have the greatest impact. AI supports the analysis; Arup's specialists remain responsible for evaluating the findings and developing recommendations. EcoPreserve could explore a smaller version of this idea: use AI to review building-performance information, compare sustainability options, and prepare an initial list of opportunities for the consultant to verify and discuss with the client.

- Arup - Data and artificial intelligence: https://www.arup.com/services/data-and-artificial-intelligence/
- Arup - AI for Future Cities: https://www.arup.com/en-us/insights/ai-for-future-cities/

For a client managing a portfolio of buildings, AI-supported analysis could compare energy and performance information across properties and help prioritize which facilities warrant further investigation. This is an illustrative application, not a claim about a specific Arup client project.

2. WSP

WSP is a global professional services and consulting company that works in buildings, infrastructure, transportation, environment, engineering, and sustainability. Its sustainability teams help clients with decarbonization, building performance, certifications, climate planning, and other environmental goals.

WSP is a strong broad competitor because its sustainable-building work directly overlaps with several EcoPreserve service areas. WSP specifically lists building performance, decarbonization, digital solutions, and green building certifications such as LEED, WELL, and Living Building Challenge.

WSP incorporates AI into digital solutions that bring together environmental and asset information to support planning and risk assessment. Its AI-enabled Nature Vista platform is one example of this approach. By analyzing information from different sources, such tools can help identify trends, flag potential risks, and present findings in a format that supports faster decisions. WSP has also discussed the use of Microsoft Copilot internally. The value is not simply producing information more quickly; it is helping consultants focus their expertise on interpreting results, valuating trade-offs, and advising clients.

EcoPreserve could explore a client dashboard or project tool that combines sustainability information and uses AI to highlight possible energy, carbon, water, waste, or environmental concerns. The consultant would then explain the findings and recommend the next action.

- WSP - Sustainable Building Consulting: https://www.wsp.com/en-gl/services/sustainable-building-consulting
- WSP - Environmental Intelligence: https://www.wsp.com/en-us/hubs/environmental-intelligence
- WSP - Artificial Intelligence Statement: https://www.wsp.com/en-th/legal/ai-statement

For a client managing multiple facilities or sites, an AI-supported platform could combine information from environmental reports, building records, and performance datasets to identify locations that may need closer assessment. This is an illustrative use case.

3. Schneider Electric

Schneider Electric is an energy-management and automation company. It provides technology, software, and services that help organizations understand and control how energy is used across buildings, infrastructure, data centers, and industrial operations.

Schneider Electric is not as direct a consulting competitor as Arup or WSP. It is better described as a partial competitor and a technology benchmark. It works with many of the same sustainability problems that EcoPreserve helps clients solve, especially energy use, emissions, building performance, and decarbonization.

Schneider Electric demonstrates how AI can become part of an ongoing client service rather than only an internal productivity tool. Its EcoStruxure Resource Advisor platform centralizes energy and sustainability information, while Resource Advisor Copilot enables users to explore that information through natural-language questions. For example, a sustainability manager could ask how emissions have changed over the past six months and use the system to locate relevant data and support analysis. Schneider Electric also applies AI in energy optimization and predictive maintenance, helping organizations anticipate performance issues and manage resources more effectively.

This could inspire EcoPreserve to eventually offer clients a simpler sustainability assistant or dashboard. A client could ask questions about energy, emissions, water, waste, or progress toward goals, while EcoPreserve consultants provide the expert interpretation and recommendations.

- Schneider Electric - AI solutions: https://www.se.com/us/en/work/solutions/artificial-intelligence/solutions/
- Schneider Electric - Resource Advisor Copilot: https://perspectives.se.com/resource-advisor/building-sustainabilitys-digital-future-with-ecostruxure-resource-advisor-copilot

A facilities team could use a centralized platform to review energy consumption across sites, explore changes in emissions, and identify unusual performance trends. The technology supports ongoing monitoring, while the organization and its advisors decide which actions to take.

Across these examples, AI is most valuable when it strengthens an existing consulting service. It can help teams consolidate information, detect patterns, compare options, and make

findings more accessible to clients. The consultant's role remains central: validating results, accounting for project context, and translating analysis into practical recommendations.
Best starting point for EcoPreserve: pick one service area, such as facilities or building performance, and test whether AI can make the consultant's existing service easier to understand, faster to deliver, or more useful to the client. Start with approved, nonconfidential data and keep a qualified consultant responsible for the final recommendation.

---

1. Arcadis

Links: https://www.arcadis.com/en/news/global/2026/arcadis-accelerates-ai-enabled-delivery-through-investment-in-nomic/
https://aecmag.com/news/arcadis-invests-in-aec-ai-platform-nomic/

Who they are: Arcadis is a German based global design, engineering, and consulting firm . Their work engages both natural and built environments. Environmental services are their making output with about 20% of its revenue coming from it.
What they're doing with AI: Arcadis has invested in an AI platform called Nomic. This platform is used for architecture, engineering, and construction tasks. Their AI agents conduct a first-pass review of drawings against Arcadis's own established standards. They also ensure that they are code compliant. In a six-month test run with around 150 engineers in 12 countries, 86% of engineers stated that it changed how they work. These workflows helped save a significant amount of time that would have been dedicated to manual document organization.
What EcoPreserve could learn: Arcadis has its AI check work against its own set standards. EcoPreserve could utilize this when it comes to file naming rules and certification checklists. The AI would do an initial check then a staff member can certify it. Arcadis also assessed their tool by asking engineers their opinions on it. This could be replicated by EcoPreserve through a simple survey.

2. ERM

Links: https://www.consultancy.uk/news/43120/erm-and-auquan-bring-agentic-ai-tosustainability-advisory
https://www.mfg-outlook.com/sustainability/erm-and-carbmee-partner-to-help-manufacturers-turn-scope-3-data-into-decarbonisation-action

Who they are: ERM is a specialist sustainability consultancy group. They help companies as well as investors handle environmental, social, and climate issues.
What they're doing with AI: ERM actually didn't create their own AI. They partnered with specialist tech companies to develop a tool. They also paired their tools directly with their consultants' expertise. Auquan is one tool they use that helps spot reputational and sustainability risks during due diligence for banks and investors. Another tool is Carbmee which gathers supplier and product level emissions data. This allows ERM to target the largest and most significant sources of a manufacturer's emissions.
What EcoPreserve could learn: ERM utilizes each AI tool for a specific task while enabling consultants to still make the final call. The tool we're creating should work the same way. It should focus on one specific task then leave the final decisions to staff. An AI tool for ecopreserve should also keep track of what the AI changes so anyone can check and modify if need be.

3. AECOM

Links: https://www.pbctoday.co.uk/news/energy-news/nature-protection-ai-toollaunched/144100/

Who they are: AECOM is an infrastructure consulting firm. Their services involve planning, designing, and managing projects in areas like transportation, buildings, water, energy, and the environment. They work with both public and private clients.
What they're doing with AI: In collaborations with the Sustainable Markets Initiative, AECOM developed the AI powered Nature Risk Tool. This tool draws on datasets from the Taskforce on Nature-related Financial Disclosures. It can look at any piece of land in the world down to a scale of meters and provide quality descriptions of the local habitats. This tool is mainly meant for site selection before a project starts.
What EcoPreserve could learn: AECOMs tool is focused on a step in the earliest stage of a project. This proactive measure allows them to save on costs. EcoPreserve could set up an organized folder structure the day a project starts, instead of organizing files right before submission.

4. Jacobs

Links: https://www.jacobs.com/solutions/flood-iq https://www.stormwater.com/stormwater-management/floodcontrol/news/55372296/jacobs-launches-ai-powered-flood-forecasting-and-responseplatform https://aquadna.jacobs.com/

Who they are: Jacobs is a Dallas based engineering and consulting firm.They plan, designs and delivers complex infrastructure, advanced technologies and critical systems.They work with governments, utilities, and infrastructure owners.

What they're doing with AI: In April of 2026, Jacobs launched Flood IQ. It combined AI tools that they had already used on client projects into one product. Their tolls have seen success for companies like United Utilities which saw a cut in sewer flooding by about 20% through their use. Jacobs calls their approach human-guided automation. The AI first forecasts problems and then ranks each alert. Then the people decide how to respond.

What EcoPreserve could learn: Jacobs was able to turn an one-off project work into a repeatable product. If EcoPreserve's document process works for one certification, it could become a standard process on each project. Jacobs' use of ranking alerts could also be beneficial. Instead of a long list of every issue, the most urgent problems would be considered first.

5. Stantec

Links: https://www.stormwater.com/stormwater-management/press-release/21272108/tennessee-employs-stantecs-flood-predictor-tool https://www.bbc.com/storyworks/beyond-the-code/stantec

Who they are: Stantec is a design and engineering firm. Their work combines environmental consulting, climate services, and digital tools. Much of their work is for the public sector for groups like state and local governments.

What they're doing with AI: Stantec created a tool called Flood Predictor. It is a machine-learning tool that is trained on traditional flood models as well as engineering studies. Tennessee implemented it into TNPlan (the state's online resilience portal). It enabled officials to check regional flood risk in real time. Before this tool, analysis like this would need complex modeling that could take months.

What EcoPreserve could learn: Stantec's AI was built on previous years of expert engineering work. EcoPreserve could do the same but on a smaller scale. They could use past certification

packages that were approved as examples. EcoPreserve's existing file system is already robust and complex, so it's important to develop a tool around it (just like Stantec).

Overall findings for EcoPreserve

Across these examples, AI is mainly helping firms handle large amounts of information, find patterns or risks, and explain complicated results more clearly. Some firms also use it to speed up review work. Their experts still play an important role in checking what AI produces. The most realistic place for EcoPreserve to begin is with its current project idea: choose one green building certification requirement, give AI the related documents and approved naming rules, then have it flag inconsistent names, suggest an organized folder layout, and prepare a linked document list. A project manager should approve changes and decide whether the documents actually satisfy the requirement.

A simple pilot could measure: (1) how many file-name problems AI correctly catches, (2) how easy the final document list is to use, and (3) whether project managers spend less time preparing the files. These results would show whether the idea is worth expanding.
